#### PHYSICAL SCIENCE

0652/5

PAPER 5 Practical Test

#### OCTOBER/NOVEMBER SESSION 2002

1 hour 30 minutes

Candidates answer on the question paper. Additional materials: As listed in Instructions to Supervisors.

TIME 1 hour 30 minutes

#### **INSTRUCTIONS TO CANDIDATES**

Write your name, Centre number and candidate number in the spaces at the top of this page. Answer **all** questions.

Write your answers in the spaces provided on the question paper.

### **INFORMATION FOR CANDIDATES**

The number of marks is given in brackets [ ] at the end of each question or part question. Chemistry practical notes for this paper are printed on page 8.

FOR EXAMINER'S USE		
1		
2		
TOTAL		

			2
1 You are going to find the energy change when a certain mass of solid <b>Z</b> dissolves in was a beaker. The first step is to find how much heat is stored by the 100 cm <sup>3</sup> glass beaker			
	(a)	(i)	Weigh the $100\mathrm{cm^3}$ glass beaker to the nearest gram. Record the mass in the space provided and convert this mass into kilograms.
			mass of beaker in grams =g
			mass of beaker in kilograms =kg [1]
		(ii)	Multiply the mass of the beaker in kg by 670. This gives the heat energy, ${\bf X}$ joules, for each degree Celsius change.
			<b>X</b> =J/°C [1]
	(b)	(i)	Weigh between $2.5\mathrm{g}$ and $3.5\mathrm{g}$ of solid $Z$ . This must be accurately weighed to the nearest $0.1\mathrm{g}$ . Write down all weighings you make and record the accurate mass of $Z$ .
			mass of <b>Z</b> =g [2]
		(ii)	Using a measuring cylinder, measure out $25\mathrm{cm}^3$ of cold water and pour into the $100\mathrm{cm}^3$ beaker.
			Measure and record the temperature $T_1$ of this water, to the nearest 0.5 °C.
			<i>T</i> <sub>1</sub> °C
			Add the weighed solid <b>Z</b> to the water and stir until it completely dissolves.
			Read and record $T_2$ , the lowest temperature reached.
			<i>T</i> <sub>2</sub> °C
			Calculate the temperature change, $\Delta T$ .

	(iii)	Use your results from <b>(a)(ii)</b> and <b>(b)(ii)</b> to calculate the total number of joules absorbed by the dissolving of <b>Z</b> in water, using the formula below.
		total heat energy absorbed = $\Delta T (\mathbf{X} + 105)$
		J [1]
(c)	Sug	gest <b>one</b> way in which you could improve the experiment.
		[1]
(d)	ls th	ne dissolving of <b>Z</b> in water endothermic or exothermic? Explain your answer.
		[1]
(0)	/i\	
(e)	(i)	Empty and rinse the beaker. Measure out $20\mathrm{cm}^3$ of the liquid <b>L</b> into the same beaker. Measure its temperature, $T_3$ , as accurately as you can and record its value.
		<i>T</i> <sub>3</sub> =°C
		You are now required to pour into this liquid $50\mathrm{cm^3}$ of water at exactly $60^\circ\mathrm{C}$ , and stir thoroughly. Record the final temperature, $T_4$ , of the mixture. The way in which you make the temperature of the water exactly $60^\circ\mathrm{C}$ is for you to decide.
		$T_4 = \dots^{\circ}C$ [2]
	(ii)	Describe how you made the temperature of the 50 cm <sup>3</sup> of water exactly 60 °C.
		[2]

[5]

2 You are going to find out how the time taken for a reaction varies with temperature. The reaction produces a precipitate which will make the solution cloudy. See Fig. 2.1.

#### Take care when handling hot liquids

(a) Mark a large cross in the centre of a piece of paper. The flask will be placed on this paper. You will look down at the cross through the solution. When the cross disappears, the reaction has finished.

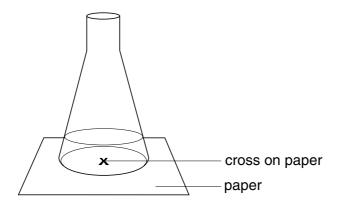

Fig. 2.1

- **(b)** Using the larger measuring cylinder, measure 50 cm<sup>3</sup> of the solution labelled **H** and pour it into the flask.
  - Warm the contents of the flask to 35 °C (this will only take a few seconds). Place the flask over the cross on the paper.
  - Using the smaller measuring cylinder, measure 5 cm<sup>3</sup> of the solution labelled J and add it to the flask containing solution H. Start the clock and swirl the flask to mix the contents
  - When you can no longer see the cross on the paper, stop the clock.
  - Record the starting temperature and time in seconds, in the table Fig. 2.2.

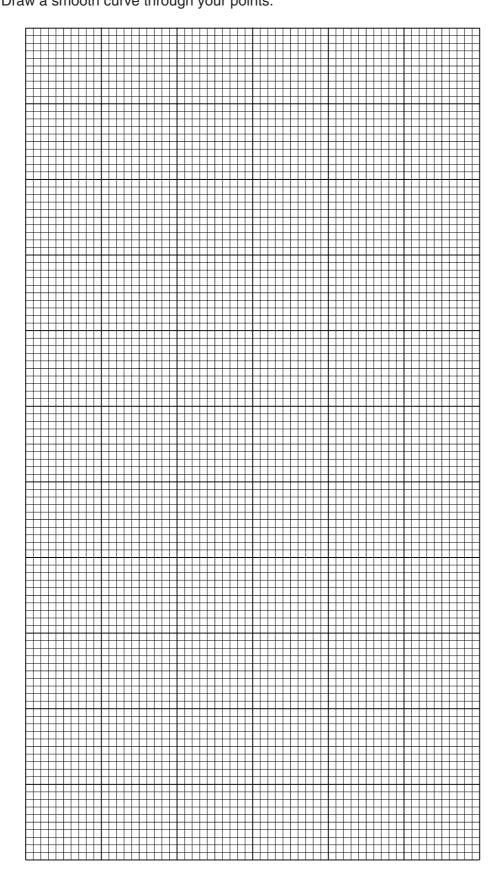

starting temperature/°C	time for cross to disappear/s

Fig. 2.2

- (c) Wash out the flask with water.
  - Repeat the above procedure but heat solution **H** to 40 °C.
  - Record the starting temperature and time in the table.
  - Repeat three more times using an increased starting temperature each time. Do not exceed a starting temperature of 70 °C

(d) Plot a graph on the grid provided of time (vertical axis) against temperature. Label the temperature axis from 0 °C to 100 °C.

Draw a smooth curve through your points.

(e)	Use your graph to answer the following questions:		
	(i)	Find the time for the reaction at 10 °C.	
		time =s	
	(ii)	Find the temperature required to produce a reaction time of 50 seconds.	
		temperature =°C	2]
(f)		scribe the relationship between the temperature and the time taken for the reaction ccur.	n
		[	1]
(g)	and	graph you have plotted does not show the relationship between <b>rate of reactio</b> temperature. Briefly explain what you would do with your results to show such tionship.	
		[	1]
(h)	Brie	fly describe how you would carry out an experiment at $0^{\circ}\text{C}$ to find the reaction time	€.
		[2	2]

## **BLANK PAGE**

# **CHEMISTRY PRACTICAL NOTES**

## **Test for anions**

anion	test	test result
carbonate (CO <sub>3</sub> <sup>2-</sup> )	add dilute acid	effervescence, carbon dioxide produced
chloride (Cl <sup>-</sup> ) [in solution]	acidify with dilute nitric acid, then add aqueous silver nitrate	white ppt.
nitrate (NO <sub>3</sub> <sup>-</sup> ) [in solution]	add aqueous sodium hydroxide, then aluminium foil; warm carefully	ammonia produced
sulphate (SO <sub>4</sub> <sup>2-</sup> ) [in solution]	acidify, then add aqueous barium chloride <i>or</i> aqueous barium nitrate	white ppt.

# Test for aqueous cations

cation	effect of aqueous sodium hydroxide	effect of aqueous ammonia
ammonium (NH <sub>4</sub> <sup>+</sup> )	ammonia produced on warming	-
copper(II) (Cu <sup>2+</sup> )	light blue ppt., insoluble in excess	light blue ppt., soluble in excess, giving a dark blue solution
iron(II) (Fe <sup>2+</sup> )	green ppt., insoluble in excess	green ppt., insoluble in excess
iron(III) (Fe <sup>3+</sup> )	red-brown ppt., insoluble in excess	red-brown ppt., insoluble in excess
zinc (Zn <sup>2+</sup> )	white ppt., soluble in excess, giving a colourless solution	white ppt., soluble in excess, giving a colourless solution

# Test for gases

gas	test and test result
ammonia (NH <sub>3</sub> )	turns damp litmus paper blue
carbon dioxide (CO <sub>2</sub> )	turns lime water milky
chlorine (Cl <sub>2</sub> )	bleaches damp litmus paper
hydrogen (H <sub>2</sub> )	'pops' with a lighted splint
oxygen (O <sub>2</sub> )	relights a glowing splint
